

FLOATING PRE-INSTALLATION BRACKETS

Stealth floating installation brackets are used where the span between structural framing is greater than 16". Used in conjunction with the PS-12 PlaceSaver™ (included), the floating installation bracket attaches to the building framing through meshed metal ears, allowing for spanning the area between joists, leaving a pre-formed installation space that fully supports the LR6g with optional BX-12 back box.

The Floating installation brackets may also be used when retrofitting LR6g speaker into finished drywall ceilings. After cutting the hole for the speaker simply rotate the Floating installation bracket (without mesh ears) but with PS-12 attached through the opening. The attached PlaceSaver™ will insure that the LR6g is centered in the opening. Secure the edges of the bracket to the surrounding drywall with screws and remove PlaceSaver.™

Floating installation brackets are built from ¾" plywood and are sized 14" x 18". The (2x) meshed metal screens can be installed on either the short or long sides of the bracket. They protrude an additional 5" per side.
